

GoHa

Goals, Habits, and ACTION — a private personal execution system.

System guide · how to use it · how to test it in full

GoHa is not a to-do app, a habit calendar, a goal list, or a timer. It is the thing that connects them. Every screen reads from one shared set of records, so a task ticked on Today is the same task in To-dos and the same task moving a goal's progress bar.

Life Area → Goal → Sub-goal → Task / Habit → Today → Focus → Complete → Reflect

What each feature does

Today **CORE**

The one screen that forms an opinion. It reads your overdue work, priorities, goals and habits, then tells you what to do next and *why* — "2 things have slipped. Start with X — 3 days late."

- **Plan my day** fills your empty Top 3 slots with the highest-ranked work, and shows what it would pick, with reasons, *before* you press it. It never reorders or removes pins you made yourself.
- **Top 3 Actions** — pin up to three priorities. Pins reference the real task, never a copy.
- **Momentum** — current streak, this week's completions vs last week, focus time.
- Quick-add, today's tasks, overdue, active goals, and today's habit check-ins.

How it ranks: lateness dominates (a late task is a promise already broken), then your own priority, then in-progress, due-today and goal linkage as tie-breakers. No AI, no prediction — a small set of stated rules you can argue with.

Goals **CORE**

Objectives with real hierarchy. A goal can have sub-goals, a life area, a timeframe and a target date. Click any goal to open its detail panel: sub-goals, the tasks actually driving the number, and where the percentage comes from.

Progress is either *auto* (computed from linked tasks, with cancelled ones excluded from the denominator) or *manual* (you set it). It is calculated on read and never stored, so it can never drift out of sync.

To-dos **CORE**

Every task, with two independent filters — **when** (Any time / Today / This week / month / quarter / year / No date) and **what state** (Not started / In progress / Late / Done / Cancelled) — so "this week's in-progress work" is expressible. Plus life-area filter and sorting.

- **List or Calendar** view of the same tasks.
- Click a task to open its **detail panel**: due date, schedule, priority, life area, goal, description, and **subtasks**. Fields save as you change them.
- Completion reflections, cancel, delete, and a late banner that jumps straight to overdue work.

Calendar EXPANSION

The unified schedule: tasks, habit occurrences and focus minutes on one month grid. Filter by layer (All / Tasks / Habits / Focus) and click any day for its detail. Distinct from the calendar inside To-dos, which stays a task-only editing surface.

Habits EXPANSION

Yes/no or measured habits (e.g. 8 glasses), with daily, specific-days, or times-per-week schedules. Today's check-in list, a week grid, and current/best streaks.

Streaks are schedule-aware: an unscheduled day never breaks a streak, a skipped day is neutral, and a habit cannot be "missed" before the day you created it.

Focus EXPANSION

A timer that records real focused time. Presets (15/25/45/60) or a custom duration, an optional linked task, pause/resume, add-time, and session notes.

Time is derived from timestamps, never a counting browser tab, so a slept laptop or a reload stays correct. Counted time is capped at the planned duration, so leaving a timer running cannot inflate your totals.

Brain Dump EXPANSION

Fast capture for messy thoughts, as coloured sticky notes on a wall. One field, one key (⌘/Ctrl + Enter). Convert any note into a **task**, **goal** or **habit** when you are ready, or archive it.

Task Map EXPANSION

A drag-and-drop canvas for how work connects. Four node types (Task, Note, Milestone, Group), drawn connections, and nodes that link to real tasks.

- **Import tasks** in bulk instead of retyping titles that already exist.
- **Colour coding you define** — a per-map legend, because "red" means something different on a house-move map than on a roadmap.

Review EXPANSION

The "Reflect" end of the chain. Left side is what actually happened that week — completed, slipped, habit consistency, focus time, goals finished, and where the effort went by life area. Right side is your reflection: what went well, what got in the way, focus for next week, and a 1–5 rating. Save a draft or complete it; arrows walk back through past weeks.

Progress EXPANSION

History you never had to record. Weekly tasks completed, weekly focus minutes, and a 26-week GitHub-style habit heatmap, each compared against the previous period.

Life Areas CORE

The top of the system and the spine of its colour. Each area has a colour and icon that then tints its goals, tasks and habits everywhere else, so colour answers "which part of my life is this?". Cards show live rollups: goals, open tasks, habits, and task completion.

Settings CORE

- **Profile** — display name.
- **Appearance** — light / dark / system.
- **Preferences** — timezone and week start, which drive every date view.
- **Daily rhythm** — when you intend to plan and reflect. GoHa sends nothing; these are intentions, and a place an external automation can read.
- **Password** — change it; other devices are signed out.
- **Archive** — everything you archived, and the button to bring it back.
- **Your data** — export everything as one JSON file.

Command palette CORE

Press  / **Ctrl+K** anywhere. Fuzzy search across actions, every screen, and your own tasks, goals and life areas. Arrows to move, Enter to go, Escape to close.

Getting started

- 1 **Create your Life Areas first.** Health, Career, Finance, Family — whatever your life actually divides into. Give each a distinct colour and icon; everything below inherits it.
- 2 **Add a goal per area.** Pick a timeframe and a target date. Leave progress on *auto* so it follows the work.
- 3 **Break goals into tasks.** From a goal's detail panel, "Add task" opens the form with the goal already selected. Schedule the ones you intend to do soon.
- 4 **Add two or three habits.** Start smaller than feels right — streaks are built by showing up.
- 5 **Use Today every morning.** Read what it recommends, press **Plan my day**, then work.
- 6 **Review on Sunday.** Open Review, read the week, write three honest lines, complete it.

The one habit that makes this work: open Today in the morning and Review on Sunday. Everything else is optional. A system you check twice is worth more than one you fill in perfectly and never revisit.

How to test everything

Run through this to exercise every feature. Roughly 20 minutes.

Setup

Start the app `pnpm dev` in the project folder
Open `http://localhost:3000`
Sign in Your owner account

Area	What to do	What should happen
Life Areas	Create one. Then edit it, then archive it.	New areas get a colour you are not already using. Cards share one baseline height.
Settings → Archive	Click "Show archive", then Restore the area you just archived.	It reappears on the Life Areas page immediately.
Goals	Create a goal, then a second one with the first as its parent. Click the parent's title.	Detail panel opens showing the sub-goal, linked tasks, and where the % comes from.
To-dos	Create a task linked to that goal. Click its title. Add two subtasks. Tick one. Set a due date.	Counter reads 1/2; the card in the list shows 1/2 and the due date. Fields save with no Save button.
To-dos filters	Switch timeframe and progress dropdowns; try "Late". Toggle Calendar view.	Counts update live. Calendar shows a month grid with your tasks.
Goal completion	Create a goal with exactly one task, then tick that task.	A trophy celebration fires — the goal hit 100%.

Habits	Create a yes/no habit and a measured one (target 8, unit "glasses"). Log both.	Days before you created it are blank, never red. Today's cell is outlined in blue.
Focus	From Today press "Focus on this". Start, pause, resume, add 5m, then complete.	The task is already selected. Paused state is obvious. Time appears in Momentum and Progress.
Brain Dump	Capture a thought, pick a colour, pin it. Then convert it to a task.	One strip of tape per note. The task appears in To-dos; the note moves to Converted.
Task Map	Create a map. Add all four node types. Drag a connection between two. Import tasks. Open Legend and name a colour.	Nodes connect and stay where you drop them. The legend key appears on the canvas and survives a reload.
Calendar	Switch the layer filter. Click a day. Page through months and press Today.	Tasks, habits and focus minutes all appear; the right rail follows your selection.
Review	Open Review. Fill the three prompts, pick a rating, Save draft. Reload. Then Complete review.	The draft survives the reload. Completing locks the fields and shows a green "Reviewed" badge.
Progress	Open it after doing the above.	Weekly bars, focus minutes, and a habit heatmap with your activity in it.
Palette	Press ⌘K / Ctrl+K. Type "prog". Press Enter. Reopen and type a task name.	Fuzzy match jumps to Progress; your own tasks are searchable.
Settings	Switch theme. Set both rhythm times, reload. Press Export.	Theme persists. Times survive the reload. A JSON file downloads.
Mobile	Narrow the window to phone width and revisit each screen.	No horizontal scrolling anywhere. Detail panels slide up from the bottom.

Testing without touching your real data. There is an isolated harness account for exactly this. Create it with `pnpm test:account:create` and remove it with `pnpm test:account:destroy`. The automated suites always use it, never your own account. Run `pnpm test` for the unit suite and `pnpm test:e2e` for the browser suite.

Rules the system keeps

- **One source of truth.** No screen keeps its own copy. Progress, streaks and date buckets are calculated when read, so they cannot drift.
- **Your timezone decides the day.** A habit logged at 12:30 AM belongs to that local date, not yesterday in UTC.
- **Archive, don't delete.** Goals, life areas, habits and maps are hidden, never destroyed, and Settings brings them back.
- **Nothing leaves without you.** No AI, no telemetry, no notifications, no third-party integrations. One database, one owner.
- **Every state is designed.** Loading, empty, error and success — no blank panels.

Keyboard

Shortcut	Does
⌘K / Ctrl+K	Open the command palette
↑ ↓	Move through results
Enter	Run the highlighted item
Esc	Close the palette, a panel, or a dialog
⌘/Ctrl + Enter	Pin a thought in Brain Dump
Enter	Add the task or subtask you are typing

GoHa — private personal execution system. Built on Next.js, Neon Postgres, Drizzle and Better Auth. Every figure in the app is derived from your own records; nothing is estimated.
